

Answers

1. What is the main difference between a point and a vector?

Answer: *A point represents a position in space, while a vector represents both direction and magnitude.*

2. True or False: Points and vectors are numerically represented by the same values.

Answer: *True.*

3. What is the magnitude of a vector?

Answer: *The magnitude of a vector is its length or size.*

4. What is the direction of a vector?

Answer: *The direction of a vector refers to the angle or orientation it points towards.*

5. True or False: A vector can have a negative magnitude.

Answer: *False. Magnitude is always positive. The direction will handle making it negative or positive.*
