

Answers

1. Lerp assumes a linear relationship between the points it's interpolating between.

Answer: True

2. Cartesian space is linear.

Answer: True

3. You can safely interpolate scale using lerp.

Answer: True, there are just other ways which may look perceptually better.

4. Lerp is not suitable for interpolating between colours in RGB space.

Answer: False, it's perfectly fine in most situations, but if you want to improve on it, you can transform to another colour space.

5. Interpolating between unit vectors using lerp always produces accurate results.

Answer: False, the vectors normally lose their unit vector property.

6. Lerp can safely be used to interpolate rotation matrices.

Answer: False

7. Lerp results on unit vectors may produce vectors that aren't of unit length.

Answer: True

8. Renormalizing vectors after lerp can fix interpolation issues.

Answer: True, most of the time

9. Interpolating in RGB space might introduce undesirable intermediary colours.

Answer: True

10. The purplish tint when lerp from yellow to blue in RGB space is an error from interpolation.

Answer: False, the resulting colour isn't an error, the colour space just doesn't match our expectations.

11. The error resulting from interpolation can sometimes be ignored in games.

Answer: True, games are generally about the end user experience

12. Colours benefit from transformation to another space before interpolation.

Answer: True
